

Our farm currently has five mustang horses, either adopted through the U.S. Bureau of Land Management, or rescued locally. Web site has some general information about mustangs, plus photos and videos of the mustangs at the farm. Several on-farm projects have also been published on our site, including parasite control, the dental development of our young mustang filly, the natural barefoot trim, the mustang hoof and the effect of composting on the fate of pathogens and veterinary drugs.

We have recently added a new page on equine nutrition. Part 1 focuses on carbohydrates/sugars in hay and grasses with special reference to laminitic and insulin resistant equines. Part 2 shows how to balance equine diets using grass hay and pasture analyses from our local area and online software from the National Research Council (Nutrient Requirements of Horses, 2007).
